

**ABSTRACT OF THE DISCLOSURE**

A method of delivering donor sheets to be subsequently processed in the process of making an organic light-emitting device including providing a roll of a flexible substrate which can either include organic layers or subsequently  
5 be coated with organic layers and unrolling a predetermined length of donor and cutting the donor sheet to a size suitable for subsequent use in depositing organic layers. The method also includes transferring the cut donor sheet into a sheet receiver onto a frame and securing the donor sheet to the sheet receiver and delivering the sheet receiver and the secured donor sheet to a position to be further  
10 processed.
